Basis of SIL Determination
& Introduction to Layers of Protection Analysis (LOPA)

Fayyaz Moazzam, CFSE
Principal Consultant
PetroRisk Middle East, Abu Dhabi, United Arab Emirates
Email: info@petrorisk.com
What is LOPA?

• Evaluate risks in *orders of magnitude* of selected accident *scenarios*
• Builds on the information developed in *qualitative hazard evaluation* e.g. HAZOP
Main Questions

LOPA helps to answer the following questions:

– What’s the **likelihood** of undesired events / scenarios?
– What’s the **risk** associated with the scenarios?
– Are there **sufficient risk mitigation measures**?
Basic Principle

Cause or Initiating Event → IPLs Failure → Undesired Consequence

Independent Protection Layer (IPL)
Safeguard capable of preventing a scenario from proceeding to its undesired consequence.
Protection Layers
The Ideal & Reality
Concept of Layers of Protection

- Community Emergency Response
- Plant Emergency Response
- Physical Protection (Dikes)
- Physical Protection (Relief Devices)
- Safety Instrumented System
- Alarms, Operator Intervention
- Basic Process Control
- Process
What is *scenario*?

*Cause* + *Consequence* = *Scenario*

LOPA is limited to evaluating *a single cause-consequence pair* as a scenario.
LOPA Five Basic Steps

2. Identify the *initiating event* of the scenario and determine the initiating event frequency (events per year).
3. Identify the IPLs and estimate the *probability of failure on demand* of each IPL.
4. Estimate the risk of scenario.
5. Compare the calculated risk with the company’s tolerable risk criteria
Basic Principle

Initiating Cause #1

Initiating Cause #2

Initiating Cause #3

Scenario

Accident

Scenario
Initiating Event (Cause)
- Control failure
- Human error
- Leakage

Enabling Events & Conditions

Conditional Modifiers
- Probability of ignition
- Probability of fatal injury
- Probability of personnel in affected area

Components in a Scenario

IPL #1 → IPL #2 → IPL #2 → Consequence

Accident

Typical IPLs:
- Process control system (PCS) control loop
- Alarms with operator response
- Pressure relief valve
- Vessel rupture disk
- Fire detection with water deluge system
- Gas monitors with automated deluge
- Check valve
- Flame arrestor
- Vacuum breaker
- Restrictive orifice
- Safety instrumented function (SIF)
- Process Design
Enabling Condition

Safety Function: LAHH-101 to close SDV-110 on high high level in V-101
Scenario: Level Control Loops Fails; LCV-130 fail closed; Level in V-101 rises;
Carry over from V-101; Compressor K-101 mechanical damage of $810,000
Company’s Tolerable Frequency : 1.0E-05 or 0.00001
Frequency of control loop failure : 0.1 /yr
Probability of LCV-130 going in close position if control loop fails: 0.8
IPL-1: High Level Alarm (LAH-100) : 0.1 (Probability of failure)
Mitigated frequency: 0.1 x 0.8 x 0.1 = 0.008
Risk Reduction Factor = Actual Frequency / Company’s Tolerable Frequency
= 0.008 / 0.00001 = 800
or PFDavg = 0.00125
Safety Function: LAHH-101 to close SDV-110 on high high level in V-101
Scenario: GV-1 closed; Level in V-101 rises; Carry over from V-101; Compressor K-101 mechanical damage of $810,000
Company’s Tolerable Frequency : 1.0E-05 or 0.00001
Frequency of operator error: 0.01 /yr

**Enabling condition:** Not applicable

**IPL-1:** High Level Alarm (LAH-100) : 0.1 (Probability of failure)  
Mitigated frequency: 0.01 x 0.1 = 0.001  
Risk Reduction Factor = Actual Frequency / Company’s Tolerable Frequency  
= 0.001 / 0.00001 = 100  
or PFDavg = 0.01
Types of Initiating Events:

- **External events**
  - Earthquakes, tornadoes, hurricanes, or floods
  - Major accidents in adjacent facilities
  - Mechanical impact by motor vehicles

- **Equipment failures**
  - Component failures in control systems
  - Corrosion
  - Vibration

- **Human failures**
  - Operational error
  - Maintenance error
Inappropriate Initiating Event

Examples of inappropriate initiating events:

– Inadequate operator training / certification
– Inadequate test and inspection
– Unavailability of protective devices such as safety valves or over-speed trips
– Unclear or imprecise operating procedures
Initiating Events Frequency Estimation

Failure Rate Data Sources:

- Industry Data (e.g. OREDA, IEEE, CCPS, AIChE)
- Company Experience
- Vendor Data
- Third Parties (EXIDA, TUV etc.)
Choosing failure rate data

- It is a Judgment Call
- Some considerations:
  - Type of services (clean / dirty ?)
  - Failure mode
  - Environment
  - Past history
  - Process experience
  - Sources of data
Initiating Event Frequency

• If initiating event frequency data is not available then it can be estimated using Fault Tree Analysis.
Initiating Events Frequency Estimation

Example
A plant has 157 relief valves which are tested annually. Over a 5 year period 3 valves failed to pass the function test. What is the failure rate for this plant’s relief valves?

Event Frequency = \( \frac{\text{Number of Events}}{\text{Time in Operation}} \)

Failure Rate for Relief Valve = \( \frac{3\ \text{function test failures}}{157\ \text{valves} \times 5\ \text{years}} \)

= 0.0038 failures per year per valve
Conditional Modifiers

- Probability of ignition
- Probability of fatal injury
- Probability of personnel in affected area
Conditional Modifiers

Probability of Ignition

– Chemical’s reactivity
– Volatility
– Auto-ignition temperature
– Potential sources of ignition that are present
Conditional Modifiers

*Probability of Personnel in the Area*

- Location of the process unit;
- The fraction of time plant personnel (e.g. personnel from operation, engineering and maintenance) spent in the vicinity
Conditional Modifiers

**Probability of Injury**

– Personnel training on handling accident scenario
– The ease of recognize a hazardous situation exists in the exposure area
– Alarm sirens and lights
– Escape time
– Accident scenario training to personnel
Independent Protection Layers

• All IPLs are safeguards, but **not** all safeguards are IPLs.

• An IPL has two main characteristics:
  – How **effective** is the IPL in preventing the scenario from resulting to the undesired consequence?
  – Is the IPL **independent** of the initiating event and the other IPLs?
Independent Protection Layers

Typical layers of protection are:

- Process Design
- Basic Process Control System (BPCS)
- Critical Alarms and Human Intervention
- Safety Instrumented System (SIS)
- Use Factor
- Physical Protection
- Post-release Protection
- Plant Emergency Response
- Community Emergency Response
Independent Protection Layers

Safeguards not usually considered IPLs

- Training and certification
- Procedures
- Normal testing and inspection
- Maintenance
- Communications
- Signs
- Fire Protection (Manual Fire Fighting etc.)
- Plant Emergency Response & Community Emergency Response
Characteristics of IPL

1. **Specificity**: An IPL is designed solely to prevent or to mitigate the consequences of one potentially hazardous event (e.g., a runaway reaction, release of toxic material, a loss of containment, or a fire). Multiple causes may lead to the same hazardous event, and therefore multiple event scenarios may initiate action of one IPL.

2. **Independence**: An IPL is independent of the other protection layers associated with the identified danger.

3. **Dependability**: It can be counted on to do what it was designed to do. Both random and systematic failure modes are addressed in the design.

4. **Auditability**: It is designed to facilitate regular validation of the protective functions. Functional testing and maintenance of the safety system is necessary.
Use of Failure Rate Data

Component Failure Data

- Data sources:
  - Guidelines for Process Equipment Reliability Data, CCPS (1986)
  - OREDA (Offshore Reliability Data)
  - Layer of Protection Analysis – Simplified Process Risk Assessment, CCPS, 2001
Use of Failure Rate Data

**Human Error Rates**

• Data sources:
Safety Instrumented Function (SIF)

- Instrumented loops that address a specific risk
- It intends to achieve or maintain a safe state for the specific hazardous event.
- A SIS may contain one or many SIFs and each is assigned a Safety Integrity Level (SIL).
- As well, a SIF may be accomplished by more than one SIS.
Understanding Safety Integrity Level (SIL)

• What does SIL mean?
  – Safety Integrity Level
  – A measure of **probability to fail on demand (PFD)** of the SIS.
  – It is statistical representation of the integrity of the SIS when a process **demand** occurs.
  – A **demand** occurs whenever the process reaches the trip condition and causes the SIS to take action.
## SIL Classification

<table>
<thead>
<tr>
<th>SIL</th>
<th>Probability Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1 in 10 to 1 in 100</td>
</tr>
<tr>
<td>2</td>
<td>1 in 100 to 1 in 1,000</td>
</tr>
<tr>
<td>3</td>
<td>1 in 1,000 to 1 in 10,000</td>
</tr>
<tr>
<td>4</td>
<td>1 in 10,000 to 1 in 100,000</td>
</tr>
</tbody>
</table>

1 in 10 means, the function will fail once in a total of 10 process demands.

1 in 1000 means, the function will fail once in a total of 1000 process demands.
## SIL Classification

### Safety Integrity Levels

<table>
<thead>
<tr>
<th>SIL Level</th>
<th>Probability of failure on demand (Demand Mode of Operation)</th>
<th>Risk Reduction Factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIL 4</td>
<td>$\geq 10^{-5}$ to $&lt;10^{-4}$</td>
<td>$\geq 0.00001$ to $&lt;0.0001$</td>
</tr>
<tr>
<td>SIL 3</td>
<td>$\geq 10^{-4}$ to $&lt;10^{-3}$</td>
<td>$\geq 0.0001$ to $&lt;0.001$</td>
</tr>
<tr>
<td>SIL 2</td>
<td>$\geq 10^{-3}$ to $&lt;10^{-2}$</td>
<td>$\geq 0.001$ to $&lt;0.01$</td>
</tr>
<tr>
<td>SIL 1</td>
<td>$\geq 10^{-2}$ to $&lt;10^{-1}$</td>
<td>$\geq 0.01$ to $&lt;0.1$</td>
</tr>
</tbody>
</table>
Setting Tolerable Frequency

For example, if there are 10,000 plants in the country and the operating company accepts the risk equivalent to one catastrophic accident leading to multiple fatalities every 10 years, then the tolerable frequency of the operating company for such an accident would be:

Tolerable Frequency = 1 occurrence per 10,000 plants every 10 years
= 1 / 10,000 / 10
= 1.0E-05 occurrence per year per plant

Or probability of catastrophic accident leading to multiple fatalities per year per plant

It would be wrong to take inverse of 1.0E-05, which would be 100,000 years, and say that a plant will have catastrophic failure every 100,000 years.
Frequency Calculation

For example, if the statistical data indicates that 1 out of 300 smokers die every year, then the frequency can be calculated as follows:

Frequency = 1 death per 300 smokers every year
= 1 death / 300 smokers / 1 year
= 3.3E-03 deaths per smoker per year

Or probability of a smoker dying per year

It would be wrong to take inverse of 3.3E-03, which would be 300 years, and say that a smoker would die every 300 years.
## Tolerable Frequencies

<table>
<thead>
<tr>
<th>Tolerable Frequency</th>
<th>People</th>
<th>Environment</th>
<th>Assets</th>
<th>Reputation</th>
</tr>
</thead>
<tbody>
<tr>
<td>2E-05 /yr</td>
<td>Multiple fatalities or permanent disabilities</td>
<td>Massive Effect- Persistent severe environmental damage</td>
<td>Substantial or a total loss of operations (&gt;$10,000,000)</td>
<td>Extensive adverse coverage in international media.</td>
</tr>
<tr>
<td>2E-04 /yr</td>
<td>Single fatality or permanent disability</td>
<td>Major effect- severe environmental damage</td>
<td>Partial operation loss and/or prolonged shutdown (&lt;$10,000,000)</td>
<td>National public concern. Extensive adverse coverage in the national media.</td>
</tr>
<tr>
<td>2E-03 /yr</td>
<td>Serious injuries (lost time cases)</td>
<td>Localized effect-Limited loss of discharge of known toxicity</td>
<td>Extended plant damage and/or partial shutdown (&lt;$500,000)</td>
<td>Regional public concern. Extensive adverse coverage in local media.</td>
</tr>
<tr>
<td>2E-02 /yr</td>
<td>Minor injuries (medical treatment cases)</td>
<td>Minor Effect Contamination</td>
<td>Moderate plant damage and/or brief operations disruption (&lt;$100,000)</td>
<td>Some local public concern. Some local media coverage.</td>
</tr>
<tr>
<td>2E-01 /yr</td>
<td>Slight injuries (first aid cases)</td>
<td>Slight release Local Environment damage</td>
<td>Minor plant damage and no disruption to Operations (&lt;$10,000)</td>
<td>Public awareness may exist, but there is no public concern.</td>
</tr>
</tbody>
</table>
1. Tolerable Frequency: $2 \times 10^{-4}$ (single fatality)

2. Initiating Events:
   - PCV-501 Fail Opened
   - Initiating Event Frequency $\rightarrow 0.1/yr$

3. Independent Protection Layers (IPLs):
   - High Pressure Alarm, PAH-100
   - Prob. of Failure on Demand $\rightarrow 0.1$

4. Actual Frequency:
   - $0.1/yr \times 0.1 = 0.01/yr$

5. Risk Reduction Factor:
   - $=\frac{\text{Actual Frequency}}{\text{Tolerable Frequency}}$
   - $=\frac{0.01}{2 \times 10^{-4}}$
   - $=50$ (SIL-1)

---

<table>
<thead>
<tr>
<th>SIL Level</th>
<th>RRF</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIL-1</td>
<td>10-100</td>
</tr>
<tr>
<td>SIL-2</td>
<td>100-1,000</td>
</tr>
<tr>
<td>SIL-3</td>
<td>1,000-10,000</td>
</tr>
<tr>
<td>SIL-4</td>
<td>10,000-100,000</td>

</tbody>
</table>
SIL Calculation

1. Tolerable Frequency: 2E-05 (multiple fatalities)
2. Initiating Events:
   PCV-501 Fail Opened
   Initiating Event Frequency → 0.1/yr
3. Independent Protection Layers (IPLs):
   High Pressure Alarm, PAH-100
   Prob. of Failure on Demand → 0.1
4. Actual Frequency:
   0.1/yr x 0.1 = 0.01/yr
5. Risk Reduction Factor:
   =Actual Frequency / Tolerable Frequency
   =0.01/2E-05
   =500 (SIL-2)
1. Tolerable Frequency: 2E-05 (multiple fatalities)

2. Initiating Events:
   - PCV-501 Fail Opened
   - Initiating Event Frequency → 0.1/yr

3. Independent Protection Layers (IPLs):
   - High Pressure Alarm, PAH-100; PFDavg → 0.1
   - Pressure Safety Valve, PSV-150; PFDavg → 0.01

4. Actual Frequency: 0.1/yr x 0.1 x 0.01 = 0.001/yr
   - (Alarm) (PSV)

5. Risk Reduction Factor:
   - = Actual Freq. / Tolerable Freq.
   - = 0.001/2E-05
   - = 50 (SIL-1)
